Quick Scan

- Grade: Grade 5 primary target; adaptable for Grade 4 or higher-support learners.
- Lesson shape: two class sessions plus optional presentation/revision time.
- Project goal: students brainstorm, build, and present a simple business model that is clearly connected to computer science.
- AI tools: MagicSchool Idea Generator and MagicSchool AI Assistant.
- Product menu: pitch deck, poster or one-pager, simple site, booklet, or short commercial script.
- Recommended product for the fastest classroom workflow: 5-slide Google Slides pitch deck.
- Core idea: AI helps students ask better questions, generate business options, organize a model, and prepare a presentation. The academic target is the business model and CS connection.

Project Definition

Student-Friendly Definition

A business model explains:

- who the business helps,
- what problem it solves,
- what product or service it offers,
- why people would want it,
- how the business could work in a fair, safe, and realistic way.

Computer Science Requirement

Every idea must include at least one computer science connection. Students may choose from:

- an app, website, game, chatbot, or digital tool,
- data collection, sorting, visualizing, or using data to make decisions,
- an algorithm, automation, step-by-step process, recommendation system, or scheduling tool,
- hardware, robotics, sensors, 3D design, or assistive technology,
- cybersecurity, privacy, safe logins, or responsible digital communication,
- accessibility or usability improvements for different users.

Non-Negotiables

- Students do not enter full names, passwords, addresses, phone numbers, or private information into AI tools.
- Ideas must be school-appropriate and safe.
- AI can suggest ideas, questions, and wording, but students must choose, check, and explain their business model.
- Students must be able to explain how their idea connects to computer science.
- Students may not make unsupported health, legal, safety, or money promises.

CS Standards Alignment

Standard	Connection	Evidence in this project
CSTA 1B-DA-06	Organize and present collected data visually to support a claim.	Students may use customer preference data, survey ideas, or simple comparison tables to explain why people would want the business.
CSTA 1B-DA-07	Use data to communicate an idea or propose relationships.	Students explain how customer needs, user choices, or product features support the business idea.
CSTA 1B-AP-12	Develop plans that describe a program's sequence of events, goals, and expected outcomes.	Students describe how their app, site, service, or digital workflow would work step by step.
CSTA 1B-AP-15	Test and debug a program or algorithm so it works as intended.	Students check whether the business workflow, AI-generated plan, or pitch structure has missing or confusing steps.
CSTA 1B-IC-18	Discuss computing technologies that have changed the world and how they influence practices.	Students explain how their business uses computing to help people or improve an existing process.
CSTA 1B-IC-19	Improve accessibility and usability of technology products for diverse users.	Students consider who may need the product, how it can be easier to use, and what accessibility supports are needed.
CSTA 1B-IC-20	Seek diverse perspectives to improve computational artifacts.	Students use peer feedback, teacher conferencing, and customer thinking to improve their business model.

Learning Targets

Students will be able to:

- identify a customer group and a problem worth solving,
- generate a CS-connected business idea using guided AI support,
- explain the product or service in a clear business model,
- use AI-generated prompts to build and improve a pitch,
- check AI output for accuracy, safety, fit, and fairness,
- present a business idea with a clear CS connection and next steps.

Materials and Setup

- Teacher-managed MagicSchool access.
- Google Slides or another presentation/product tool.
- Projector for teacher modeling.
- Printed or digital business model organizer.

- Copy-ready prompt cards or classwork post with prompts.
- Rubric and exit tickets.
- Optional: Canva, logo tool, drawing paper, sticky notes, speech-to-text, headphones, partner checklist.

Data to Provide to Both AI Tools

Paste This Context Into the Tool Setup

Students are in Grade 5. They are brainstorming and building a simple business model that must connect to computer science. The business idea should solve a real or realistic problem for a specific customer group. The idea can be an app, website, game, data tool, automation, digital service, robot/sensor product, cybersecurity idea, accessibility tool, or another school-appropriate technology solution. Students should not use private information. Keep language clear, short, and student-friendly. Ask questions before giving final ideas when a student needs help. Help students choose, narrow, organize, and present their own business model.

CS Connection Menu for Students

- App or website: a digital place where users do something helpful.
- Game or simulation: users learn, practice, or solve a problem.
- Data tool: collects, sorts, counts, compares, or visualizes information.
- Algorithm or automation: follows steps to make a decision or complete a task.
- Robot, sensor, or 3D design: uses hardware or design to solve a problem.
- Cybersecurity or privacy: protects information or teaches safe digital choices.
- Accessibility technology: helps more people use, understand, or access something.

Business Model Fields

- Business name.
- Customer or user.
- Problem.
- CS-connected solution.
- Key features.
- How it helps.
- How people find or use it.
- Safety, privacy, or fairness check.
- Simple pitch sentence.

MagicSchool Idea Generator Setup

Tool Purpose

Use Idea Generator first. Its job is to interview students about interests and needs, then suggest CS-connected business ideas and send students into AI Assistant with useful follow-up prompts.

Copy-Ready Setup Fields

Tool Description

You are a Grade 5 business idea coach for a computer science entrepreneurship project. Help students turn their interests into school-appropriate business model ideas that clearly connect to computer science. Do not give a final idea immediately if the student is unsure. First ask short questions to learn the student's interests, possible customers, and problems they care about. Then suggest several business ideas. Each idea must include a customer, problem, CS-connected solution, and one prompt the student can copy into AI Assistant to build the business model.

What Do Your Students Need Ideas For?

Students need ideas for a simple CS-connected business model they can present. The business should solve a problem for a specific customer group using technology, data, algorithms, apps, websites, games, automation, robotics, cybersecurity, privacy, accessibility, or digital communication.

Additional Fields or Instructions

Ask the student 3 quick questions before suggesting ideas if the student has not provided a clear interest. Use choice-based questions when possible. Keep reading level appropriate for Grade 5. Give 4 business ideas. For each idea, include:

1. Business name idea
2. Customer or user
3. Problem solved
4. CS connection
5. Why people might want it
6. Copy-ready AI Assistant prompt for building the idea

Avoid unsafe, private, expensive, or unrealistic ideas. Do not ask for personal information. Do not choose the final idea for the student. End by asking: Which idea do you want to build?

MagicSchool AI Assistant Setup

Tool Purpose

Use AI Assistant after a student has one possible business idea. Its job is to help students build a business model, organize a pitch, check the CS connection, and prepare to present.

Copy-Ready Setup Fields

Tool Description

You are a Grade 5 business model coach for a computer science project. Help students turn one CS-connected business idea into a clear, realistic, school-appropriate business model and presentation. Ask clarifying questions when needed. Keep student voice and student choice at the center. Help with structure, examples, checklist feedback, slide organization, and speaker notes. Do not write a finished project that the student can copy without thinking. Remind students to check the output, make choices, and explain the CS connection in their own words.

Student Task Context

The student is creating a simple business model pitch. The pitch should include: business name, customer, problem, CS-connected solution, 3 to 5 key features, why people would want it, safety/privacy/fairness check, and a short presentation script. The product can be a Google Slides pitch deck, poster, one-pager, simple site, booklet, or commercial script. The business must connect to computer science.

Additional Fields or Instructions

When students ask for help, respond in short sections. Use this structure when possible:

1. What you already have
2. What to improve
3. Suggested next step
4. Student choice question

If building a pitch deck, suggest exactly 5 slides:

Slide 1: Business name and customer

Slide 2: Problem

Slide 3: CS-connected solution

Slide 4: Features and how it works

Slide 5: Why people would want it and final pitch

Always include a CS check and a privacy/fairness check. Do not ask for personal information.

Do not grade students. Do not make the decision for the student.

Lesson 1: Discover a CS-Connected Business Idea

Objective

Students use Idea Generator to explore interests, answer guiding questions, and choose one CS-connected business idea. Students leave with a business idea, a CS connection, and copy-ready AI Assistant prompts for Lesson 2.

Teacher Mini-Lesson and Modeling

1. Define a business model in kid language: customer, problem, solution, value.
2. Model the difference between a general idea and a CS-connected business idea.
3. Show one example: “I like recess” becomes “RecessBuddy, a scheduling app that helps students find fair teams and game choices.”
4. Model how Idea Generator asks questions before suggesting ideas.
5. Name the success criteria: one customer, one problem, one CS-connected solution.

Guided Practice

Use a shared class example:

Interest: animals. Possible business: PetCare Helper, a kid-friendly app that reminds families about feeding, walks, and cleaning.

Ask students to identify:

- Who is the customer?
- What problem is solved?
- What makes it computer science?
- Is it small enough to present?

Work Time

1. Students list 2 interests or problems they notice.
2. Students use Idea Generator to answer questions and get 4 CS-connected business ideas.
3. Students choose 1 idea to consider.
4. Students copy the AI Assistant prompt connected to that idea.
5. Students complete the Lesson 1 business idea ticket.

Lesson 1 Student Prompt Frames

- My interests are ____ and _____. Ask me 3 questions, then give me 4 CS-connected business ideas.
- I care about _____. What business could I create that uses computer science to help people?
- I want to help _____. Give me 4 business ideas that use technology, data, apps, games, or automation.
- My possible idea is _____. Is it a business model and is it connected to computer science?

Closure and Proof of Learning

Students complete:

- My business idea is:
- My customer is:
- The problem is:
- My CS connection is:
- The AI Assistant prompt I will use next is:

Lesson 2: Build and Present the Business Model

Objective

Students use AI Assistant to turn one approved idea into a simple business model pitch. Students build a product and prepare to explain the customer, problem, CS solution, value, and responsible technology choices.

Teacher Mini-Lesson and Modeling

1. Reopen the class example from Lesson 1.
2. Show how one AI Assistant prompt becomes a 5-slide pitch plan.
3. Model checking the AI output: Does it name the customer? Is the CS connection real? Is it safe and realistic?
4. Model turning AI suggestions into student choices, not copying a finished answer.

Guided Practice

Students compare two sample slides:

- Weak: “My app is cool and everyone will use it.”
- Strong: “RecessBuddy helps Grade 5 students choose fair teams by using a simple algorithm that balances player choices.”

Discuss which one is clearer and why.

Work Time

1. Students open their Lesson 1 idea ticket.
2. Students paste the AI Assistant prompt they saved.
3. Students build a 5-part pitch: customer, problem, CS solution, features, and value.
4. Students check the pitch against the rubric.
5. Students prepare a 30-second explanation.

Lesson 2 Student Prompt Frames

- My business idea is _____. Help me make a 5-slide pitch deck plan.
- My customer is _____ and the problem is _____. Help me explain the problem clearly.
- My solution uses computer science because _____. Help me explain that in Grade 5 words.
- Here is my slide draft: _____. What is missing from my business model?
- Help me write a 30-second pitch. Keep it clear and student-friendly.
- Check my business idea for privacy, safety, fairness, and accessibility.

Closure and Proof of Learning

Students submit or show:

- one completed slide, section, or poster area,
- one sentence explaining the CS connection,
- one revision they made after using AI or feedback,
- one next step before presenting.

Student Presentation Requirements

Recommended 5-Slide Pitch Deck

1. Business name and customer.
2. Problem.
3. CS-connected solution.
4. Features and how it works.
5. Why people would want it and final pitch.

Simple Pitch Script

Our business is called _____. It helps _____ who need _____. The problem is _____.
Our solution uses computer science by _____. People would want it because _____. One
safety, privacy, or fairness choice we made is _____.

Rubric

Category	Beginning	Developing	Meeting
Customer and problem clarity	Customer or problem is missing, too broad, or difficult to explain.	Names a customer and problem, but the connection may need more detail or focus.	Clearly names a customer and a realistic problem the business is trying to solve.
CS connection	The idea does not yet show a clear computer science connection.	The idea includes technology, but the CS connection needs clearer explanation.	The idea clearly connects to computing, data, algorithms, apps, automation, privacy, accessibility, or another CS concept.
Business model logic	The product or service is unclear or unrealistic.	The business idea mostly makes sense but needs stronger features, audience fit, or value explanation.	The business model explains the solution, key features, and why people would want it.

Use of Idea Generator	Uses AI only with heavy support or accepts ideas without thinking.	Uses Idea Generator to get ideas and chooses one with some support.	Uses Idea Generator to explore options, compare choices, and select a CS-connected idea.
Use of AI Assistant	Copies too much or does not check the AI response.	Uses AI Assistant for help, but checking and revising are inconsistent.	Uses AI Assistant to organize, improve, check, and present the business model while keeping student decision-making visible.
Responsible technology choices	Does not yet address privacy, safety, fairness, or accessibility.	Mentions one responsible technology issue but needs clearer connection to the business.	Explains at least one privacy, safety, fairness, or accessibility choice connected to the idea.
Presentation and communication	Presentation is incomplete or hard to follow.	Presentation communicates the main idea but needs clearer organization or evidence.	Presentation is clear, organized, and explains the customer, problem, CS solution, and value.

Exit Tickets

Lesson 1 Exit Ticket

Question	Student Response
What is your business idea?	
Who is your customer or user?	
What problem does it solve?	
How is it connected to computer science?	
Which AI Assistant prompt will you use next?	

Lesson 2 Exit Ticket

Question	Student Response
What part of your pitch did you build today?	
What did AI help you improve?	
What did you choose or change yourself?	
What is your strongest CS connection?	
What is your next step before presenting?	

Inclusive Strategies and Supports

- Start with oral rehearsal: students talk or draw before typing.
- Provide interest lanes: sports, animals, games, food, school helpers, environment, art, music, safety, accessibility, community.
- Use choice-based AI questions for students who struggle with open-ended prompts.
- Pair students with clear roles: driver, reader, checker, presenter.
- Give reduced-text organizers with only customer, problem, solution, CS connection, and pitch sentence.
- Allow speech-to-text, teacher scribing, drawing, icons, labels, or verbal explanation.
- Use checkpoints: idea approved, CS connection approved, pitch structure approved, presentation ready.
- Extend advanced learners by asking them to compare two customer groups, improve accessibility, add simple data evidence, or explain a privacy tradeoff.

Teacher Look-Fors

- Students can explain who the business helps.
- Students can name the problem before naming the product.
- Students can explain why the solution is connected to computer science.
- Students use AI to ask questions, organize, check, and revise.
- Students do not copy a finished response without understanding it.
- Students include at least one responsible technology choice.

Student Slide Deck Outlines

Lesson 1 Presentation: Find Your Business Idea

1. Today: find a business idea.

2. What is a business model?
3. Your idea must connect to CS.
4. Use Idea Generator first.
5. Questions the AI may ask.
6. Prompt cards.
7. Example from interest to business idea.
8. Choose one idea.
9. Exit ticket.

Lesson 2 Presentation: Build Your Pitch

1. Today: build and present.
2. Recover your Lesson 1 idea.
3. Use AI Assistant.
4. 5-slide pitch structure.
5. Prompt cards.
6. Worked example.
7. Check for CS, privacy, fairness, and accessibility.
8. Rehearse a 30-second pitch.
9. Exit ticket.
